An automatic lubrication system (ALS) lubricates continuously while the machine is working. This increases efficiency as there is no need to stop machinery for lubrication. Lubricating while the bearings are rotating also improves the distribution of lubricant. A small amount of grease remains flowing, keeping out contamination

Lubrication system is used to introduce oil and other lubricants to give a flow to the clean oil at the accurate temperature, with an appropriate pressure to moving machine parts. The oil is sucked out into the pump from the sump thereby reducing the friction between parts, and therefore increasing the longevity of all components.

It's the lubrication system's way of saying, "Settle down, kids." Oil filter: While Oliver and his friends are allowed to pass into the engine, the filter stops any dirt and debris the oil may have picked up on its last pass through the system. Spurt holes and galleries:

The lubrication system of an engine provides a supply of lubricating oil to the various moving parts in the engine. Its main function is to enable the formation of a film of oil between the moving parts, which reduces friction and wear. The lubricating oil is also used as a cleaner and in some engines as a coolant.

Lubrication reduces friction between the moving surfaces or rolling pairs. Some of the various types include hydrodynamic, hydrostatic, boundary and extreme pressure lubrication. The lubricant also act as a coolant carrying heat away from the sliding surfaces so it is necessary for all the moving parts in machinery or engine operation.

## **How The Lubrication System Works In An Engine? - Lubrita.com**

An automatic lubrication system (ALS), often referred to as a centralized lubrication system, is a system that delivers controlled amounts of lubricant to multiple locations on a machine while the machine is operating. Even though these systems are usually fully automated, a system that requires a manual pump or button activation is still identified as a centralized lubrication system.

Maintaining your lubrication system. To keep your engine in proper working order, you need to maintain the lubrication system. This means changing the oil and filter as recommended in your owner's manual, which is usually every 3,000 to 7,000 miles. You also must use only the grade of oil that is recommended by the manufacturer.

Schematic diagram of a basic dry-sump engine lubrication system. The oil collects in sump (1), is withdrawn continuously by scavenge pump (2) and travels to the oil tank (3), where gases entrained in the oil separate and the oil cools. Gases (6) are returned to the engine sump. Pressure pump (4) forces the de-gassed and cooled oil (5)
