Abstract. Alluvial placer deposits may be divided into autochthonous and allochthonous subtypes. Autochthonous placers contain large heavy mineral grains that are practically immovable by streams and thus occur adjacent to primary ore deposits. Rich "bottom" autochthonous placers accumulate during many stages of river development and are concentrated at the base of the alluvium or in the crevices of its bedrock.

Geological features of alluvial placers | Economic Geology ...

Alluvial placer deposits may be divided into autochthonous and allochthonous ubtypes. Autochthonous placers contain large heavy mineral grains that are practically immovable by streams and thus occur adjacent to primary ore deposits.

Geological Features of Alluvial Placers - CORE

Alluvial Placers - Prospector's Paradise Alluvial is the name for placer deposits formed by water action in a stream or river. For most people, it ' s all about alluvial deposits, or to be blunt, the allure of gold, with the odd precious and semi-precious gem thrown into the mix. You can still become an amateur gold or gem miner. Geological Features of Alluvial Placers - CORE Alluvial Placers An alluvial deposit is an ancient river-washed rock and gravel bar that may be

Geological Features Of Alluvial Placers

In geology, a placer deposit or placer is an accumulation of valuable minerals formed by gravity separation from a specific source rock during sedimentary processes. The name is from the Spanish word placer, meaning "alluvial sand". Placer mining is an important source of gold, and was the main technique used in the early years of many gold rushes, including the California Gold Rush. Types of placer deposits include alluvium, eluvium, beach placers, and paleoplacers. Placer materials must be bot

Placer deposit - Wikipedia

The comparison of observation results with reconstructions of placer-forming fluvial processes demonstrates the distinct dependence of all basic properties of placers on the dynamics of their formation, i.e., on the hydraulic size of gold grains, the dimensions of streams, and the phase of the elementary erosion cycle (PEC).
