This book Computer Modelling of Seas and Coastal Regions is the first volume of the two volume proceedings of the International Conference on Computer Modelling of Seas and Coastal Regions and Boundary Elements and Fluid Dynamics, held in Southampton, U.K., in April 1992. The

importance of accurate modelling of seas and coastal regions is emphasized by the need for predicting their behaviour under extreme conditions. Problems, such as pollution of these areas, have become a major international concern and the related environmental problems need further study using techniques which can be used to

determine the ways in which the water systems respond to different effects and try to minimize the damage. They can also lead to the development of early warning systems in combination with remote sensing equipment and experimental sampling techniques. Furthermore, once a disaster occurs, the model can be used to optimize

the use of the available resources. The conference addresses coastal region modelling both under normal and extreme conditions, with special reference to practical problems, currently being experienced around the world. Many of the delegates are actively involved in the modelling of seas and coastal regions. This

case of, for example, a drill, a bit, a vibrator, or an excavation tool, requires sophisticated and new methods in numerical modelling. Often the simulation of the construction procedure is neglected in the calculations. Such methods are described and discussed in this book, as are examples of the methods applied to geotechnical practice, field and
