Refactoring is about improving

the design of existing code. It is

the process of changing a

software system in such a way

that it does not alter the external

behavior of the code, yet

improves its internal structure.

With refactoring you can even

take a bad design and rework it

into a good one.

Refactoring: Improving the Design of Existing Code shows how refactoring can make object-oriented code simpler and easier to maintain. Today refactoring requires considerable design know-how, but once tools become available, all programmers should be able to improve their code using refactoring techniques.

"Refactoring: Improving the Design of Existing Code" is focused on OO programming (lots of Java examples) and Agile practices. It is setup as a catalog of refactoring techniques. Each page dedicated to a refactoring is clearly marked, s Refactoring is the process of rewriting software, without changing the way it functions, in order to improve its readability, testability or maintainability.

Refactoring is a controlled technique for improving the design of an existing code base. Its essence is applying a series of small behavior-preserving transformations, each of which "too small to be worth doing".

## ~~Refactoring — Martin Fowler~~

In computer programming and software design, code refactoring is the process of restructuring existing computer code—changing the factoring—without changing its external behavior. Refactoring is intended to improve the design, structure, and/or implementation of the software, while preserving its functionality. Potential advantages of refactoring may include improved code readability and reduced complexity; these can improve the source code's maintainability and create a simpler, cleaner ...

~~Code refactoring — Wikipedia~~

Refactoring is a disciplined technique for restructuring an existing body of code, altering its internal structure without changing its external behavior. Its heart is a series of small behavior preserving transformations.

~~Refactoring~~

In other words, refactoring, though done on source code, has the objective of improving the design that the code implements. Therefore, the basic principles of design guide the refactoring process. Consequently, a refactoring generally results in one or more of the following: 1. Reduced coupling 2. Increased cohesion 3.
