This UFC provides guidance for Department of Defense facilities to achieve high performance and sustainable building requirements in compliance with the Energy Policy Act of 2005, the Energy Independence and Security Act of 2007, EO 13423, EO 13514, and the Guiding Principles for Federal Leadership in High Performance and Sustainable Buildings (Guiding Principles).

The purpose of this Engineer Technical Letter (ETL) is to provide guidance on ground improvement for USACE civil works and military programs projects. The enclosed document (Appendix A) contains an up-to-date overview of ground improvement techniques and related considerations. It addresses general evaluation of site and soil conditions, selection of improvement methods, preliminary cost estimating, design, construction, and performance evaluation for ground improvement. This document should be used as a resource during planning, design, and construction for new projects as well as a reference to guide more detailed design efforts for modification of our aging inventory of existing projects, particularly embankment dams. The use of such state-of-the-practice techniques is in keeping with good engineering practice and provides better service to our customers in concert with the USACE Strategic Vision.

This manual presents fundamental principles underlying the design and construction of earth and rock-fill dams. The general principles presented herein are also applicable to the design and construction of earth levees.

The U.S. Army Corps of Engineers has long been one of the federal government's key agencies in planning the uses of the nation's waterways and water resources. Though responsible for a range of water-related programs, the Corps's two traditional programs have been flood damage reduction and navigation enhancement. The water resource needs of the nation, however, have for decades been shifting away from engineered control of watersheds toward restoration of ecosystem services and natural hydrologic variability. In response to these shifting needs, legislation was enacted in 1990 which initiated the Corps's involvement in ecological restoration, which is now on par with the Corps's traditional flood damage reduction and navigation roles. This book provides an analysis of the Corps's efforts in ecological restoration, and provides broader recommendations on how the corps might streamline their planning process. It also assesses the impacts of federal legislation on the Corps planning and projects, and provides recommendations on how relevant federal policies might be altered in order to improve Corps planning. Another important shift affecting the Corps has been federal cost-sharing arrangements (enacted in 1986), mandating greater financial participation in Corps water projects by local co-sponsors. The book describes how this has affected the Corps-sponsor relationship, and comments upon

how each group must adjust to new planning and political realities.

EM-385-1-1 manual is vital in getting and maintaining work on government contracts. It includes all safety and health requirements for all Corps of Engineers activities and operations, including Naval Facilities Engineering Command (NAVFAC) construction and Department of Defense projects.

The "Red Book" presents a background to conventional foundation analysis and design. The text is not intended to replace the much more comprehensive 'standard' textbooks, but rather to support and augment these in a few important areas, supplying methods applicable to practical cases handled daily by practising engineers and providing the basic soil mechanics background to those methods. It concentrates on the static design for stationary foundation conditions. Although the topic is far from exhaustively treated, it does intend to present most of the basic material needed for a practising engineer involved in routine geotechnical design, as well as provide the tools for an engineering student to approach and solve common geotechnical design problems.
