Firm valuation is currently a very exciting topic. It is interesting for those economists engaged in either practice or theory, particularly for those in finance. The literature on firm valuation recommends logical, quantitative methods, which deal with establishing today's value of future free cash flows. In this respect firm valuation is identical with the calculation of the discounted cash flow, DCF. There are, however, different coexistent versions, which seem to compete against each other. Entity approach and equity approach are thus differentiated. Acronyms are often used, such as APV (adjusted present value) or WACC (weighted average cost of capital), whereby these two concepts are classified under entity approach. Why are there several procedures and not just one? Do they all lead to the same result? If not,

where do the economic differences lie? If so, for what purpose are different methods needed? And further: do the known procedures suffice? Or are there situations where none of the concepts developed up to now delivers the correct value of the firm? If so, how is the appropriate valuation formula to be found? These questions are not just interesting for theoreticians; even the practitioner who is confronted with the task of marketing his or her results has to deal with it. The authors systematically clarify the way in which these different variations of the DCF concept are related throughout the book ENDORSEMENTS FOR LÖFFLER: DISCOUNTED 0-470-87044-3 "Compared with the huge number of books on pragmatic approaches to discounted cash flow valuation, there are remarkably few that lay out the theoretical underpinnings of this technique. Kruschwitz and Löffler bring together the theory in this area in a consistent and rigorous way that should be useful for all serious students of the topic." --Ian Cooper, London Business School "This treatise on the market valuation of corporate cash flows offers the first reconciliation of conventional cost-of-capital valuation models from the corporate finance literature with state-pricing (or 'risk-neutral' pricing) models subsequently developed on the basis of multi-period no-arbitrage theories. Using an entertaining style, Kruschwitz and Löffler develop a precise and theoretically consistent definition of 'cost of capital', and provoke readers to drop vague or contradictory alternatives." --Darrell Duffie, Stanford University "Handling firm and personal income taxes properly in valuation involves complex considerations. This book offers a new, precise, clear and concise theoretical path that is pleasant to read. Now it is the practitioners task to translate this approach into real-world applications!" --Wolfgang Wagner, PricewaterhouseCoopers "It is an interesting book, which has some new results and it fills a gap in the literature between the usual undergraduate material and the very abstract PhD material in such books as that of Duffie (Dynamic Asset Pricing Theory). The style is very engaging, which is rare in books pitched at this level." --Martin Lally, University of Wellington

Bachelor Thesis from the year 2003 in the subject Business economics - Investment and Finance, grade: 1,3 (A), Northumbria University (Newcastle Business School), language: English, abstract: This study investigates the underlying theories and assumptions of two modern capital market-based valuation approaches, the Discounted-Cash-Flow (DCF) and the Economic-Value-Added (EVA) approach, which are nowadays applied principally for industrial and manufacturing firms. This general examination is then transferred into a more specific investigation exploring whether these valuation concepts can be applied to the strongly regulated and more specific field of bank valuation. A questionnaire addressing bank analysts was created to analyse this question. The project indicates that the ideas of shareholder value which have been enforced over the last decade have implemented the need for a more shareholder-focused valuation. The application of DCF is basically attributed to this movement. It is revealed that this concept uses cash flow streams which depict a more realistic picture of an organization's true earning power. Moreover, it employs a discount rate based on the capital market and thus reflecting the yield expectations of the investors. EVA, on the other hand is a relatively new concept, copyrighted in 1994 by Stern Stewart. It highlights an organization's true economic profits. The study examines its components NOPAT, Capital and Cost of Capital, establishes a relation to DCF, points out some general limitations due to the fact that it falls back on accounting figures and critically assesses its dependence on the CAPM whose inherent assumptions of efficient markets that are not transferable into reality, might affect the valuation. The primary research undertaken finally reveals that the concepts of DCF and EVA are basically suitable to be applied to the valuation of banks. However, there are some peculiarities, primarily due to difficulties associated with the defin

Equity Valuation reviews and critically examines the standard approach to equity valuation using a constant risk-adjusted cost of capital and develops a new valuation approach discounting risk-adjusted fundamentals using nominal zero-coupon interest rates. Equity Valuation is organized as follows. Chapter 2 (Risk-adjusted Discount Rates) reviews standard valuation models based on risk-adjusted discount rates. Chapter 3 (Multi-period Asset Pricing Theory and Accounting Relations) examines key results from multi-period asset pricing theory in discrete-time, and shows how equity valuation models can equivalently be based on free cash flows or accrual accounting numbers. Based on these results, the authors derive an accounting-based multi-period equity valuation model presented in Chapter 4 (An Accounting-based Multi-period Equity Valuation Model) with equilibrium risk-adjustments determined by prices of aggregate consumption claims. Chapter 5 (Equity Valuation with HARA Utility) includes a general equilibrium analysis of a setting in which the investors have HARA utility, and aggregate consumption and residual operating income are jointly normally distributed. A set of appendices follows including Appendix B that extends the setting to preferences with external habit formation (which recently has gained popularity in asset pricing theory), and Appendix C, which discusses the relationship between risk-adjusted expected cash flows and certainty equivalents.
